Efflorescence is history!

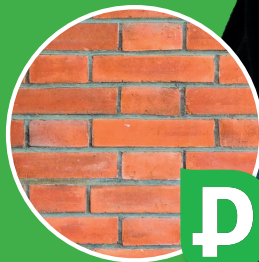

Efflorescence is the biggest irritation in construction. A chemical reaction that can occur in new masonry. The result? An ugly, persistent efflorescence about your new masonry that is almost impossible to remove.

But of course BionicProtect offers the solution!

By applying Bionic-Protect immediately within 2-3 weeks after laying the brickwork, efflorescence can no longer emerge. So it's actually an efflorescence preventer! The brickwork is immediately protected in a natural way against dirt and water. For years!

Applying BionicProtect beforehand saves you a lot of work and irritation afterwards.

Apply with only 1 thin coat / use 1 liter up to 20m² / 10 year guarantee on non-fading effect.

TCKI demonstrates: "Efflorescence
is now a thing of the past thanks to
BionicProtect!"
